

STORE INVENTORY EXCEPTION DASHBOARD

Business Requirements Document

Practice portfolio sample using a fictional retail scenario

Prepared by	Vineet Tandel
Document type	Business requirements and user stories
Version	1.0
Data classification	Mock data / portfolio use

This document is an independently created practice sample. It is not based on a confidential employer system.

1. Background

Regional and store managers receive inventory information from several reports. They can see sales and stock levels, but it takes time to identify which stores or product categories need attention. The proposed dashboard will bring the main measures into one view and highlight records with low availability.

2. Objective

Provide a simple weekly dashboard that helps managers review sales, product availability and stockout risk, then follow up with the right store or category owner.

3. Stakeholders

Stakeholder	Need	Use of dashboard
Regional Manager	A clear view of performance across stores	Reviews exceptions and assigns follow-up actions
Store Manager	Store-level sales and availability information	Checks problem categories and confirms corrective action
Operations Analyst	Consistent data and business rules	Refreshes data, validates results and supports users

4. Scope

4.1 In scope

- Monthly and weekly sales summary.
- Product availability by store, region and category.
- Stockout flag when availability is below 90%.
- Filters for period, region, store and category.
- Export of the filtered view to Excel or PDF.

4.2 Out of scope

- Automatic purchase-order creation.
- Supplier contract management.
- Real-time point-of-sale integration.

5. Assumptions

- Source data is refreshed before the weekly review.
- Each store and product has a unique identifier.
- Users only see stores and regions they are authorized to review.

6. Functional Requirements

ID	Requirement	Priority	Reason
FR-01	The dashboard shall display total sales, units sold, average availability and stockout count.	Must	Provides the main weekly KPIs.
FR-02	The user shall be able to filter the dashboard by period, region, store and category.	Must	Supports focused review.
FR-03	Records with availability below 90% shall be clearly flagged.	Must	Helps users find stockout risk.
FR-04	The dashboard shall show monthly sales and availability trends.	Should	Shows whether performance is improving.
FR-05	The user shall be able to export the current filtered view.	Should	Supports meeting notes and follow-up.
FR-06	The dashboard shall display the last refresh date.	Must	Confirms data currency.

7. Non-Functional Requirements

ID	Requirement	Measure
NFR-01	The main dashboard should open within 10 seconds under normal conditions.	Page load time
NFR-02	The layout should remain readable on a standard laptop screen.	No horizontal scrolling on the main page
NFR-03	Access should follow existing role-based permissions.	Authorized data only

8. User Stories

US-01: As a regional manager, I want to compare stores so that I can focus on the locations with the largest gaps.

US-02: As a store manager, I want to see categories below the availability threshold so that I can take corrective action.

US-03: As an operations analyst, I want the refresh date to be visible so that users know whether the report is current.

US-04: As a manager, I want to export the filtered view so that I can share the same information during follow-up.

9. Acceptance Criteria

US-02 — Identify low availability

- Given the dashboard is open, when availability is below 90%, then the record is marked as a stockout risk.
- Given a region filter is selected, when the page refreshes, then only stores in that region are included.
- Given no record is below 90%, when the page loads, then the stockout count displays zero.

US-04 — Export filtered view

- Given filters are active, when the user selects Export, then the output contains the same filtered records.
- The export includes the report period and refresh date.

10. Simple Process Flow

Step	Activity	Description
1	Data refresh	Operations analyst loads the latest sales and inventory file.
2	Validation	The analyst checks row counts, missing values and key totals.
3	Dashboard update	The report refreshes the KPI cards, trends and exception list.
4	Weekly review	Regional managers review stockout risks and assign actions.
5	Follow-up	Store managers update the action status before the next review.

11. Data Fields

Field	Type	Description
Period	Date	Reporting month or week.
Store ID	Text	Unique store identifier.
Region	Text	Operating region.
Category	Text	Product category.
Sales Amount	Currency	Units sold multiplied by average unit price.
Availability %	Percentage	In-stock SKUs divided by planned SKUs.
Stockout Flag	Text	Stockout risk when availability is below 90%.

12. Testing Notes

- Compare dashboard totals with the source file for one selected month.
- Test every filter separately and in combination.
- Confirm that records at exactly 90% are not flagged as stockout risk.
- Confirm export results match the filtered dashboard.

13. Approval and Change Log

Version	Date	Change	Owner
1.0	Portfolio sample	Initial draft	Vineet Tandel
